description

These dual monolithic J-K flip-flops are negative-edge-triggered. They feature individual J, K, clock, and asynchronous clear inputs to each flip-flop. When the clock goes high, the inputs are enabled and data will be accepted. Logical state of J and K inputs may be allowed to change when the clock pulse is in a high state and bistable will perform according to the truth table as long minimum set-up times are observed. Input data is transferred to the outputs on the negative edge of the clock pulse.

The SN54H103 is characterized for operation over the full military temperature range of −55°C to 125°C. The SN74H103 is characterized for operation from 0° to 70°C.

† For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions.
‡ All typical values are at V_{CC} = 5 V, T_A = 25°C.
§ Not more than one output should be shorted at a time, and duration of short-circuit should not exceed one second.
NOTE 2: With all outputs open, I_{CC} is measured with the Q and $\overline{Q}$ outputs high in turn. At the time of measurement, the clock input is grounded.
