

CMOS linear image sensor

S11639

**High sensitivity,
photosensitive area with vertically long pixels**

The S11639 is a high sensitivity CMOS linear image sensor using a photosensitive area with vertically long pixels ($14 \times 200 \mu\text{m}$). Other features include high sensitivity and high resistance in the UV region. The S11639 operates from a single 5 V supply making it suitable for use in low cost spectrometers.

Features

- Pixel size: $14 \times 200 \mu\text{m}$
- 2048 pixels
- Effective photosensitive area length: 28.672 mm
- High sensitivity: $1300 \text{ V}/(\text{lx}\cdot\text{s})$
- High sensitivity in UV to NIR region (spectral response range: 200 to 1000 nm)
- Simultaneous charge integration for all pixels
- Variable integration time function (electronic shutter function)
- 5 V single power supply operation
- Built-in timing generator allows operation with only start and clock pulse inputs
- Video data rate: 10 MHz max.

Applications

- Spectrometers
- Position detection
- Image reading
- Encoders

Structure

Parameter	Specification	Unit
Number of pixels	2048	-
Pixel size	14×200	μm
Photosensitive area length	28.672	mm
Package	LCP (liquid crystal polymer)	-
Window material	Quartz	-

Absolute maximum ratings

Parameter	Symbol	Condition	Value	Unit
Supply voltage	Vdd	Ta=25 °C	-0.3 to +6	V
Clock pulse voltage	V(CLK)	Ta=25 °C	-0.3 to +6	V
Start pulse voltage	V(ST)	Ta=25 °C	-0.3 to +6	V
Operating temperature*1	Topr		-40 to +65	°C
Storage temperature*1	Tstg		-40 to +65	°C

*1: No condensation

Note: Exceeding the absolute maximum ratings even momentarily may cause a drop in product quality. Always be sure to use the product within the absolute maximum ratings.

Recommended terminal voltage (Ta=25 °C)

Parameter	Symbol	Min.	Typ.	Max.	Unit
Supply voltage	Vdd	4.75	5	5.25	V
Clock pulse voltage	V(CLK)	3	Vdd	Vdd + 0.25	V
		0	-	0.3	V
Start pulse voltage	V(ST)	3	Vdd	Vdd + 0.25	V
		0	-	0.3	V

Input terminal capacitance (Ta=25 °C, Vdd=5 V)

Parameter	Symbol	Min.	Typ.	Max.	Unit
Clock pulse input terminal capacitance	C(CLK)	-	5	-	pF
Start pulse input terminal capacitance	C(ST)	-	5	-	pF

Electrical characteristics [Ta=25 °C, Vdd=5 V, V(CLK)=V(ST)=5 V]

Parameter	Symbol	Min.	Typ.	Max.	Unit
Clock pulse frequency	f(CLK)	200 k	5 M	10 M	Hz
Video data rate	VR	-	f(CLK)	-	Hz
Output impedance	Zo	70	-	260	Ω
Current consumption*2 *3	I	20	30	50	mA

*2: f(CLK)=10 MHz

*3: Current consumption increases as the clock pulse frequency increases. The current consumption is 10 mA typ. at f(CLK)=200 kHz.

Electrical and optical characteristics [Ta=25 °C, Vdd=5 V, V(CLK)=V(ST)=5 V, f(CLK)=10 MHz]

Parameter	Symbol	Min.	Typ.	Max.	Unit
Spectral response range	λ	200 to 1000			nm
Peak sensitivity wavelength	λp	-	700	-	nm
Photosensitivity*4	R	-	1300	-	V/(lx·s)
Conversion efficiency*5	CE	-	25	-	μV/e ⁻
Dark output voltage*6	Vd	0	0.4	-	mV
Saturation output voltage*7	Vsat	1.5	2.0	-	V
Readout noise	Nr	0.5	1.0	-	mV rms
Dynamic range 1*8	DR1	-	2000	-	times
Dynamic range 2*9	DR2	-	5000	-	times
Output offset voltage	Vo	0.3	0.5	0.9	V
Photoresponse nonuniformity*4 *10	PRNU	-	±2	±10	%
Image lag*11	IL	-	-	0.1	%

*4: Measured with a tungsten lamp of 2856 K

*5: Output voltage generated per one electron

*6: Integration time=10 ms

*7: Difference from Vo

*8: DR1= Vsat/Nr

*9: DR2= Vsat/Vd

Integration time=10 ms

Dark output voltage is proportional to the integration time and so the shorter the integration time, the wider the dynamic range.

*10: Photoresponse nonuniformity (PRNU) is the output nonuniformity that occurs when the entire photosensitive area is uniformly illuminated by light which is 50% of the saturation exposure level. PRNU is measured using 2042 pixels excluding 3 pixels each at both ends, and is defined as follows:

$$\text{PRNU} = \frac{\Delta X}{X} \times 100 (\%)$$

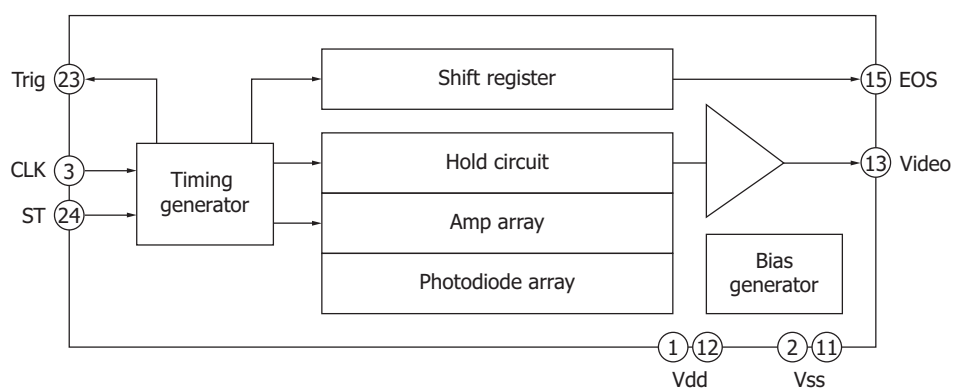

X: average output of all pixels, ΔX: difference between X and maximum output or minimum output

*11: Signal components of the preceding line data that still remain even after the data is read out in a saturation output state.

Image lag increases when the output exceeds the saturation output voltage.

Spectral response (typical example)

KMPDB0394EA

Block diagram

KMPDC0398EA

Output waveform of one pixel

The timing for acquiring the Video signal is synchronized with the rising edge of a trigger pulse (See red arrow below.).

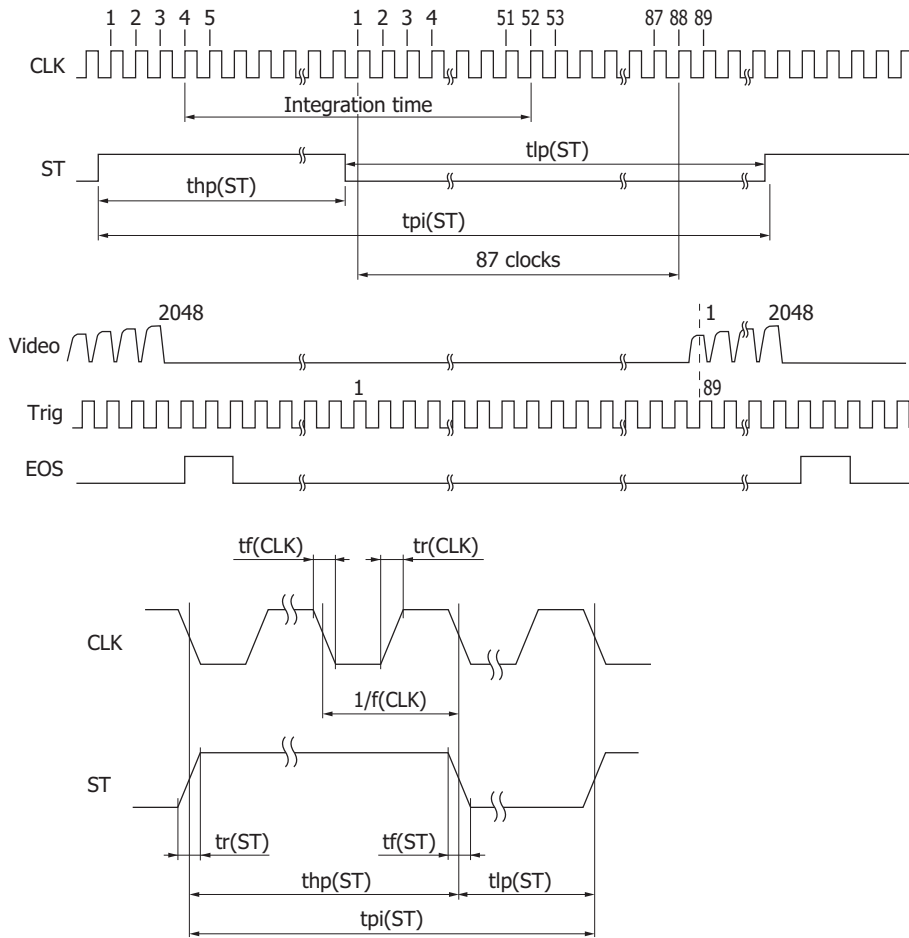

$f(\text{CLK}) = \text{VR} = 10 \text{ MHz}$

$f(\text{CLK}) = \text{VR} = 1 \text{ MHz}$

Timing chart

KMPDC0399EB

Parameter	Symbol	Min.	Typ.	Max.	Unit
Start pulse width interval ^{*12}	tpi(ST)	98/f(CLK)	-	-	s
Start pulse high period ^{*12 *13}	thp(ST)	6/f(CLK)	-	-	s
Start pulse low period	tlp(ST)	92/f(CLK)	-	-	s
Start pulse rise and fall times	tr(ST), tf(ST)	0	10	30	ns
Clock pulse duty	-	45	50	55	%
Clock pulse rise and fall times	tr(CLK), tf(CLK)	0	10	30	ns

^{*12}: Dark output increases if the start pulse period or the start pulse high period is lengthened.

^{*13}: The integration time equals the high period of ST plus 48 CLK cycles.

The shift register starts operation at the rising edge of CLK immediately after ST goes low.

The integration time can be changed by changing the ratio of the high and low periods of ST.

If the first Trig pulse after ST goes low is counted as the first pulse, the Video signal is acquired at the rising edge of the 89th Trig pulse.

Operation example

When the clock pulse frequency is maximized (video data rate is also maximized), the time of one scan is minimized, and the integration time is maximized (for outputting signals from all 2048 channels)

Clock pulse frequency = Video data rate = 10 MHz

Start pulse cycle = $2140/f(\text{CLK}) = 2140/10 \text{ MHz} = 214 \mu\text{s}$

High period of start pulse = Start pulse cycle - Start pulse's low period min.

$= 2140/f(\text{CLK}) - 92/f(\text{CLK}) = 2140/10 \text{ MHz} - 92/10 \text{ MHz} = 204.8 \mu\text{s}$

Integration time is equal to the high period of start pulse + 48 cycles of clock pulses, so it will be $204.8 + 4.8 = 209.6 \mu\text{s}$.

Dimensional outline (unit: mm)

KMPDA0294EB

Pin connections

Pin no.	Symbol	I/O	Description	Pin no.	Symbol	I/O	Description
1	Vdd	I	Supply voltage	13	Video	O	Video signal
2	Vss		GND	14	NC		No connection
3	CLK	I	Clock pulse	15	EOS	O	End of scan
4	NC		No connection	16	NC		No connection
5	NC		No connection	17	NC		No connection
6	NC		No connection	18	NC		No connection
7	NC		No connection	19	NC		No connection
8	NC		No connection	20	NC		No connection
9	NC		No connection	21	NC		No connection
10	NC		No connection	22	NC		No connection
11	Vss		GND	23	Trig	O	Trigger pulse for video signal acquisition
12	Vdd	I	Supply voltage	24	ST	I	Start pulse

Note: Leave the "NC" terminals open and do not connect them to GND.

Connect a buffer amplifier for impedance conversion to the video output terminal so as to minimize the current flow. As the buffer amplifier, use a high input impedance operational amplifier with JFET or CMOS input.

Application circuit example

KMPDC0418EA

■ Precautions

(1) Electrostatic countermeasures

This device has a built-in protection circuit against static electrical charges. However, to prevent destroying the device with electrostatic charges, take countermeasures such as grounding yourself, the workbench and tools to prevent static discharges. Also protect this device from surge voltages which might be caused by peripheral equipment.

(2) Light input window

If dust or dirt gets on the light input window, it will show up as black blemishes on the image. When cleaning, avoid rubbing the window surface with dry cloth or dry cotton swab, since doing so may generate static electricity. Use soft cloth, paper or a cotton swab moistened with alcohol to wipe dust and dirt off the window surface. Then blow compressed air onto the window surface so that no spot or stain remains.

(3) Soldering

To prevent damaging the device during soldering, take precautions to prevent excessive soldering temperatures and times. Soldering should be performed within 5 seconds at a soldering temperature below 260 °C.

(4) Operating and storage environments

Always observe the rated temperature range when handling the device. Operating or storing the device at an excessively high temperature and humidity may cause variations in performance characteristics and must be avoided.

(5) UV exposure

This device is designed to suppress performance deterioration due to UV exposure. Even so, avoid unnecessary UV exposure to the device. Also, be careful not to allow UV light to strike the cemented portion of the glass.
